APP BUILD PLAN · VERSION 1.0

BOOZER

Legal alcohol delivery with a safe ride home built in.

From idea to pilot in 12 weeks: scope, design, architecture, roadmap, compliance.
Dates and costs are targets to validate. Not legal advice.

1 Product and MVP scope

BOOZER is one app with two jobs: get a verified adult a legal delivery from a licensed retailer, and make sure there is an easy, safe way to get home. The MVP proves one thing: people in one city will order, and a share of them will use the ride credit.

Module	Build first (MVP)	Later (phase 2+)
Customer app	Sign-up, age and ID check, catalog with search and filters, cart, checkout, live order tracking	Smart recommendations, group orders and split payments, subscriptions
Safe ride	Ride credit with every order, in-app ride booking through a partner, trip sharing with a trusted contact	Group safety coordinator, geofencing alerts, own driver network
Safety	SOS button, emergency contacts, responsible-drinking reminders	Challenges, badges, community
Retailer portal	Order queue, stock toggle, payouts	Multi-store analytics, promotions where legal
Admin	Orders, users, retailers, KYC review, refunds, basic dashboard	Campaign tools, advanced analytics
Parked	Virtual party rooms, video chat, forums, gamification	Revisit once retention data exists

Why park the social features: they triple the build, add moderation risk, and sit awkwardly beside a safety mission. Investors care more about repeat orders than party rooms.

2 Design direction

The goal is trust first, fun second. The app should feel calm and premium at 11 pm on a phone, and make safety one tap away.

Ink	Amber	Cream	Teal	Rust
#101820	#E8A33D	#F6F3EE	#2A9D8F	#C4571A

Area	Decision
Look and feel	Dark mode first for night use, warm amber highlights, generous spacing, rounded cards, one primary action per screen
Type	Inter (free) for UI. Three sizes for most screens: title, body, caption
Trust cues	"Licensed retailer" and "ID verified" badges on every product and order
Safety UX	A persistent SOS and "Get a ride" button on tracking screens, large tap targets, one-thumb use
Motion	Light and purposeful: order progress, map movement, success states

Ten key screens to design first

Customer	Retailer and admin
1. Onboarding and age/ID check 2. Home and catalog 3. Product detail 4. Cart and checkout 5. Live order tracking map 6. Ride booking 7. Safety centre and SOS 8. Orders and profile	9. Retailer order queue 10. Admin dashboard (orders, KYC review, refunds)

3 Core user flows

Flow	Steps	Rules built in
Order	Open app, verify age and ID once, browse, add to cart, pay, track delivery, confirm age at the door	Delivery only from licensed retailers, in permitted areas and hours, with legal prices
Ride home	After delivery or from any order, tap "Get a ride", apply credit, share trip with a trusted contact	Credit expires, capped per order
SOS	Hold SOS button, alert goes to trusted contacts and emergency services with live location	Works from tracking and ride screens
Retailer	Accept order, pack, hand over to rider, mark dispatched, see payout	Stock and licence documents checked at onboarding
Admin	Review flagged KYC, handle refunds, suspend retailers, view daily dashboard	All actions logged

4 Architecture and tech stack

Keep it simple: one mobile codebase, one backend service, one main database. Split services later, only if load demands it.

Layer	Recommendation	Notes
Mobile	React Native with Expo	One codebase for Android and iOS
Web portals	React with a UI kit such as MUI	Retailer portal and admin in one web app
Backend	Spring Boot (Java), modular monolith	Modules: auth, catalog, orders, payments, rides, safety
Database	PostgreSQL for users, orders and payments; optional MongoDB for catalog and logs	Orders and payments need transactions, so SQL fits better than MongoDB
Maps and tracking	Google Maps Platform	Live tracking and geofencing

Layer	Recommendation	Notes
Payments	Razorpay	Confirm alcohol is allowed on your gateway account before building
KYC	DigiLocker through a licensed KYC provider	Store the minimum data and follow the DPDP Act
Rides	Start with deep links or a partner agreement (Ola, Uber, Rapido or a local fleet)	Lyft is not in India. Confirm each partner allows this use
Notifications	Firebase Cloud Messaging plus an SMS provider	Order, ride and SOS alerts
Hosting and ops	AWS Mumbai region, GitHub Actions CI/CD	Supports data localisation; add monitoring and alerts
Security	HTTPS, JWT with refresh tokens, encrypted KYC data, audit logs	Penetration test before launch

5 Core data model

Entity	Key fields
User	id, phone, name, date of birth, kyc_status, trusted_contacts
KycRecord	user_id, provider_ref, verified_at, age_verified (store the result, not raw documents)
Retailer	id, licence_no, state, hours, delivery_zone, payout_account
Product / Stock	id, retailer_id, name, price (legal MRP), stock, age_restricted
Order / OrderItem	id, user_id, retailer_id, items, status, address, delivered_at, age_check_at_door
Payment	order_id, gateway_ref, amount, status, refund_status
RideBooking / RideCredit	user_id, order_id, partner, status, credit_amount, expires_at
SafetyEvent	user_id, type (SOS, share), location, created_at, resolved_at
AuditLog	actor, action, entity, timestamp

6 12-week roadmap

Weeks	Focus	Deliverables
Before week 1	Legal and partners	Pick launch state, confirm delivery rules with a lawyer, sign 3 to 5 licensed retailers
1 to 2	Discovery and design	Wireframes, design system, clickable prototype, user tests with 8 to 10 people
3 to 4	Foundations	Auth, KYC integration, catalog, backend skeleton, CI/CD, staging environment
5 to 7	Ordering	Cart, checkout, payments, retailer portal, order tracking, notifications
8 to 9	Ride and safety	Ride partner integration, ride credits, SOS, trusted-contact sharing
10 to 11	Admin and hardening	Admin dashboard, analytics, QA, security testing, load test
12	Closed pilot	Invite-only launch in one city, store submission, feedback loop

Targets, not guarantees. KYC approvals, payment gateway onboarding and app store review often take longer than the code does, so start them in week 1.

7 Team and tools

Role	Count	Focus
Product / project lead	1	Scope, partners, timeline
UI/UX designer	1	Design system, prototype, screens
Mobile developers	2	React Native app
Backend developer	1 to 2	Spring Boot, APIs, integrations
Web developer	1 (can be shared)	Retailer portal and admin
QA / DevOps	1	Testing, CI/CD, monitoring
Legal and compliance advisor	Part-time	Licences, KYC, advertising rules

Tools: Figma (design), GitHub (code and CI), Jira or Linear (tasks), Sentry (errors), Mixpanel or PostHog (analytics).

8 Compliance and safety checklist

	Check before launch
☐	Launch state allows home delivery of alcohol; written legal opinion on file
☐	Every order fulfilled by a licensed retailer; licence documents verified
☐	Age and ID verification at sign-up and again at the door
☐	Legal pricing only: no surge pricing, no alcohol discounts unless counsel approves
☐	No alcohol advertising, surrogate advertising, influencer or campus campaigns
☐	Ride partners and drivers background-checked; SOS and GPS on every trip
☐	Privacy policy, consent flows and data deletion aligned with the DPDP Act
☐	Incident process: who responds to an SOS, how fast, and who is accountable

9 Top risks and next steps

Risk	Response
State rules block delivery	Launch only where clearly permitted; keep legal counsel on retainer
Ride partners refuse intoxicated riders or API use	Early partner talks; fall back to deep links or a small own fleet
Payment gateway rejects alcohol	Confirm category in week 1; line up a second gateway
Low repeat orders	Measure retention weekly in the pilot before expanding
Under-age access	Dual age checks, audit logs, retailer penalties for violations

Next five steps

1. Choose the launch city and get a legal opinion on delivery rules.
2. Shortlist and sign 3 to 5 licensed retailers.
3. Open KYC and payment gateway onboarding.
4. Commission wireframes and a clickable prototype.
5. Hire or contract the core team and start week 1.
